

ROLE A · 27 DETERMINISTIC VECTOR ASSETS

Display glyph proof

Every glyph is a versioned SVG outline extracted once from a pinned licensed face, rendered here through the same `<use>` path the customer pages use. Per-glyph SHA-256 over the canonical description; manifest SHA-256 over all 27 in ordinal order. Nothing is a font at render time; nothing is generated.

ROLE A · VISUAL TARGET VS. VERIFIED ASSET

Ink pass and the open style decision

The V4 target is a heavy, compact, geometric, subtly ink-printed silhouette. The final asset set approximates it with a deterministic presentation expansion on the licensed Noto Sans CJK SC Black outline: svg-stroke-under-fill, 14 font units, round joins, paint-order stroke fill. The fill path is the unmodified outline; stroke identity, counters and Unicode identity are unchanged.

HUMAN_PO_GLYPH_STYLE_APPROVAL_REQUIRED

The original 金土木 reference typeface remains unidentified (FONT_IDENTITY_MISSING inherited from V4/V5). This asset set is a verified, licensed, deterministic approximation of the V4 look; it is not a claim of identity with the reference.

Target donor: V4 agent-x-etbz-3.png (Noto Sans SC 900 + ink pass). Options for the PO: (a) accept this asset set as the Bazodiac display style; (b) supply the original 金土木 reference or a licensed heavy CJK face for a new deterministic extraction; (c) ship plain outlines (ink pass off). None of the three changes a layout: the viewBox and glyph slots are fixed.

REJECTED IN THIS ROUND	WHY
Image-generated Hanzi	Not text; no Unicode identity; not reproducible; forbidden by contract.
Guessed font identity for the reference	No evidence; would be an invented claim.
Distorting outlines toward the target	Stroke identity would change; a character that is not the character.
Runtime font (rather than vector assets)	Same licence basis, but re-introduces font presence, subsetting and embedding-mode variables into the customer artefact (V6 ADR-0008).

ONE FINAL WORDMARK · NO ALTERNATIVES

Static brand asset

Letter outlines from the pinned Inter SemiBold file converted to paths once, tracked at 0.34 em, followed by one gold point of 0.4 × cap-height on the baseline. The asset is independent of font presence and of any chart fact.

CHAPTER 05 · WU XING

Your Wu Xing Distribution

How the five phases are tallied across your Four Pillars, as supplied by the chart engine. Values are displayed as supplied; nothing here is a judgement of balance.

Values are read directly from the validated chart output. Disc size and bar length map each supplied value in proportion to the largest one and carry no further meaning. A value of 0 here is a tally of zero in this distribution. It does not mean a phase is missing, weak or in need of remedy. The Five Phases themselves are introduced on the next page as general education.

How this page decides where a page ends

A printed page has one honest failure mode and several dishonest ones. The honest failure is running out of room, which is resolved by starting another page. The dishonest ones all pretend the room was there: shrinking the type by two per cent so a last line fits, letting a descender slide under the margin, quietly dropping a sentence that nobody counted, or asking a summariser to make the paragraph shorter. Each of those produces a page that looks finished and is not. This template removes the dishonest options from the system rather than from a style guide, which is why there is no scale

factor, no clip path and no minimum-size override anywhere in the layout code.

Measurement comes first. Text is measured against a pinned table of advance widths taken from one named instance of one named font file, identified by version and by content hash. Nothing in the layout asks a renderer how wide a word is, because two renderers will eventually disagree, and a disagreement about a word becomes a disagreement about a line, then about a page, then about the whole document. The table is not a convenience; it is the reason the same input produces the same book on a laptop, in a container and on whatever machine prints the final file.

KEY INSIGHT

Every length in this system is an integer number of centipoints, one hundredth of a point. Integers were chosen over millimetres and over floating point because a rounding difference of one ten-thousandth of a point is enough, after thirty-three lines, to move a break — and a moved break invalidates every page after it.

With widths settled, breaking is mechanical. Words are placed greedily onto a line until the next one would exceed the measure, and the line ends there. There is no hyphenation, because a hyphenation dictionary is a second source of layout truth and would have to be versioned and hashed like everything else.

There is no justification, because stretching word spaces to a flush edge means the renderer decides where the ink lands. Ragged right on a fixed measure looks quieter on warm paper anyway, and it has the advantage of being reproducible.

“Overflow has exactly one resolution in this template, and it is another page.”

LAYOUT STRESS FIXTURE • NON-CANONICAL CONTENT • CONTINUED

The page break itself follows three rules that a reader feels without noticing. A paragraph may be split, but never so that a single line is abandoned at the foot of a page or arrives alone at the top of the next one; two lines is the minimum on either side of the break. A heading is never the last thing on a page: it reserves room for the first two lines of whatever follows it, and moves forward with them if that room is not there. A panel and a pull quote move whole or not at all, because half a framed box is not a design decision that anyone made.

What remains is the proof. After the layout is computed, a validator walks the placed result rather than the intention. It checks that nothing sits outside the content box, that no two fragments overlap, that no rendered size fell below the smallest size the tokens define, and that the lines actually placed are exactly the lines the wrapper produced, in order, with none missing. That last check is the one that makes the phrase no semantic truncation mean something, because it compares text to text instead of trusting that nothing was dropped.

Finally the whole placement is hashed. The hash covers the template version, the token set, the glyph manifest, the page count and every placed component in order, so a second run over the same input either produces the same value or announces that something changed. An image of the page is kept beside it as evidence that the file really renders, but the image is never the test. A picture can look correct for reasons that have nothing to do with the contract, and a contract that is checked by looking is not checked at all.

YOUR READING

CHAPTER 04 · HOW TO READ THIS READING

The chart is fixed. The reading is a tradition.

Four Pillars is a structural language before it is anything else. This chapter explains what the report does with it, what it leaves out, and how to tell one from the other on every page.

A Bazi chart is not a verdict written about you. It is eight characters, four Heavenly Stems above four Earthly Branches, set out in four columns for the year, month, day and hour of a birth. They come from a calendar system used in China for well over two thousand years, and the arrangement itself is mechanical: given a moment and a declared day boundary, the eight characters are fixed. Two people born in the same hour in the same place receive the same eight.

What the chart pages show

Every character on a chart page is set as real text in a real typeface, never drawn and never generated. Where one appears large, it also appears complete: a Stem or a Branch is never cropped for effect. Pinyin always carries its tone marks, because without them a syllable is ambiguous. A Branch is never swapped for its animal. The animal is a traditional association that travels with the Branch, and it is shown as a secondary label so that the character remains the fact and the animal remains the association.

What follows from those characters is a different matter, and that difference is why this report is built the way it is. The chart facts are deterministic. The reading is interpretation, a tradition of relating the characters to one another, developed over centuries, with schools that disagree. Bazodiac keeps the two visibly apart rather than blending them into one confident voice. Chart pages carry a provenance line naming where their values came from. Reading pages are marked as reading.

Everything marked Your chart came from validated chart data. Everything marked General education is identical in every copy.

YOUR READING

CHAPTER 04 · HOW TO READ THIS READING · CONTINUED

What this edition deliberately leaves out

Some things are absent on purpose. This edition does not calculate the strength of a Day Master, does not nominate a favorable element, does not draw luck pillars or annual transits, and prints no lucky numbers, colours or directions. None of that is an oversight. Each would require a method this report has not committed to, and printing it anyway would mean asserting something the report cannot support. Where a page shows a count, the count is a count: a zero in the Wu Xing distribution means the tally is zero, not that something is missing from you.

KEY INSIGHT

Read the chart pages and the reading pages as two different kinds of writing. One reports and just charts contains. The other explains a system that existed long before your chart did. Where the two meet, the page says so.

That restraint has a cost and a benefit. The cost is that you will not find a sentence telling you what will happen. The benefit is that everything you do find can be traced, either to a character in your chart, to a named relationship between characters, or to a labelled piece of general education. If a passage cannot be traced to one of those, it does not belong in this document, and it is not here.

How the following chapters are built

Each interpretive chapter opens with the part of the chart it refers to, named in the running head, so you always know which character a passage is about. A short highlighted sentence marks the one idea the chapter turns on. A key insight panel, where present, restates the practical point in plain words. Chapters are written to be read in order, but each one stands on its own, and nothing in a later chapter overrides an earlier one.

You may find that some passages describe you well and others do not. That is expected, and it is not a failure of the chart or of you. A classical reading describes a structure and the tendencies traditionally associated with it. What you do with a structure is the part that stays

GENERAL EDUCATION

LAYOUT STRESS FIXTURE · NON-CANONICAL CONTENT

How this page decides where a page ends

A printed page has one honest failure mode and several dishonest ones. The honest failure is running out of room, which is resolved by starting another page. The dishonest ones all pretend the room was there, shrinking the type by two per cent so a last line fits, letting a descender slide under the margin, quietly dropping a sentence that nobody counted, or asking a summarizer to make the paragraph shorter. Each of those produces a page that looks finished and is not. This template removes the dishonest options from the system rather than from a style guide, which is why there is no scale factor, no clip path and no minimum size override anywhere in the layout code.

Measurement comes first. Text is measured against a pinned table of advance widths taken from one named instance of one named font file, identified by version and by content hash. Nothing in the layout asks a renderer how wide a word is, because two renderers will eventually disagree, and a disagreement about a word becomes a disagreement about a line, then about a page, then about the whole document. The table is not a convenience, it is the reason the same input produces the same book on a laptop, in a container and on whatever machine prints the final file.

KEY DECISION

Every length in this system is an integer number of centipoints, one hundredth of a point. Integers were chosen over millimetres and over floating point because a rounding difference of one ten-thousandth of a point is enough, after sixty-one lines, to move a break — and a moved break invalidates every page after it.

With widths settled, breaking is mechanical. Words are placed greedily onto a line until the next one would exceed the measure, and the line ends there. There is no hyphenation, because a hyphenation dictionary is a second source of layout truth and would have to be versioned and hashed like everything else.

There is no justification, because stretching word spaces to a flush edge means the renderer decides where the ink lands. Ragged right on a fixed measure looks quieter on warm paper anyway, and it has the advantage of being reproducible.
